Week 31 Agenda — Feedback Discussion on the Final Draft

Purpose of This Meeting

Use the annotated comments on the report draft to identify the main problems in the current version and confirm how the next revision should be prioritised.

Topics for Discussion

- ① Main issues raised in the annotated feedback on the draft
- ② Why the current **Methodology** chapter is not yet working well enough
- ③ Specific changes planned for the next revision
- ④ Which remaining sections should be prioritised after the **Methods** rewrite

Main Goal

Leave this meeting with a clear and defensible revision plan for the next draft.

1. Core Issues Identified in the Feedback

Main Writing Problems

- Methods and results are mixed together
- Some explanation appears too interpretive for a methods chapter
- Several claims are stronger than the evidence currently shown
- Some statements need references or weaker wording

Main Structural Problems

- The boundary between Literature Review and Methods is not always clear
- Some technical content appears before it is properly introduced
- The chapter does not yet read like a clean reproducible protocol

Most Important Overall Message

The current chapter is not being judged mainly on whether the technical method is good or bad. The bigger problem is that it does not yet read like a proper **Methods** chapter.

Interpretation

The next revision should focus first on clarity, reproducibility, and chapter boundaries, rather than on adding more technical novelty.

2. Why the Current Methodology Chapter Needs Revision

What Is Missing or Unclear

- Dataset description is incomplete
- Sampling rates and channel context need to be clearer
- Preprocessing choices need stronger justification
- Normalisation procedure is not explicit enough
- Model details are not yet reproducible enough
- Training / validation / testing protocol needs to be clearer

What Is Currently in the Wrong Place

- Accuracy improvements appearing inside the methods chapter
- Comparative performance statements before the results chapter
- Interpretation of why performance changed before the evidence is shown

Expected Revision Direction

Chapter 3 should answer “what was done and how”, while Chapter 4 should answer “what happened” and “what it means”.

3. Planned Rewrite of the Methods Chapter

Feedback Area	Planned Change	Priority
Results mixed into Methods	Move all accuracy gains, comparisons, and outcome statements into Chapter 4	High
Dataset description too thin	Add sampling rate, channel count, class definition, and protocol table	High
Preprocessing not reproducible enough	State filter range, epoch length, normalisation rule, and ICA status explicitly	High
Model description too abstract	Add clearer EEGTransformer architecture explanation, figure, and config summary	High
Training protocol unclear	Clarify subject-dependent, LOSO, pooled training, and fine-tuning procedures	High
Some claims too strong	Add references where needed or reduce certainty in wording	Medium

4. Proposed Logic for the Next Draft

Chapter 2: Literature Review

- Explain the existing ML classification landscape
- Introduce benchmark datasets and prior methods
- Set up why the project approach is reasonable

Chapter 3: Methods

- Datasets used
- Preprocessing pipeline
- EEGTransformer architecture
- Training protocol
- Channel reduction protocol
- RL formulation

Chapter 4: Results and Discussion

- Classification results
- Channel reduction results
- RL performance
- ICA / filter ablation results
- Interpretation and limitations

Benefit of This Separation

The report becomes easier to follow because the marker no longer has to mentally separate protocol, evidence, and interpretation while reading the same section.

5. Additional Improvements Planned Beyond Methods

Writing / Presentation

- Reduce over-strong interpretive language
- Use more cautious phrasing where evidence is limited
- Improve figure readability, especially overview diagrams
- Standardise terms such as *participant* where appropriate

Final Report Structure

- Check alignment with handbook and report template
- Ensure Project Management is presented correctly
- Improve appendix organisation
- Include repository evidence and supporting materials clearly

Reason for These Changes

Even if the technical work is strong, weak structure and unclear academic writing could reduce the overall impression of the report.

6. Revision Plan After This Meeting

Task	Planned Outcome	Order
Rewrite Methods chapter	Clean reproducible protocol chapter with no embedded results	1
Reorganise Results / Discussion	Move outcomes and interpretation to the correct sections	2
Tighten language and citations	Fewer unsupported claims and clearer academic tone	3
Check format against template	Draft looks closer to a final submission	4
Final consistency pass	Stable terminology, figure quality, and appendix structure	5

Question for This Meeting

After the Methods rewrite, which section should be treated as the next highest priority: **Discussion**, **overall structure / formatting**, or **appendix / submission packaging**?
